Key words : Amphidinolide O, Cytotoxic macrolide, Stereoselective synthesis, Diastereoselective anti-aldol reaction

The amphidinolides are a series of cytotoxic macrolides isolated from the marine dinoflagellate Amphidinium sp., which is a symbiotic with Okinawan marine flatworm Amphiscolops sp. Amphidinolide O (1) exhibited in vitro cytotoxicity against L1210 and human epidermoid carcinoma KB cells ( $\mathrm{IC}_{50}: 1.7$ and $3.6 \mu \mathrm{~g} / \mathrm{mL}$, respectively). ${ }^{1}$ Several synthetic strategies for amphidinolide $\mathrm{A},{ }^{2} \mathrm{~B},{ }^{3} \mathrm{C},{ }^{4} \mathrm{G},{ }^{5}$ $\mathrm{H},{ }^{5}$ and $\mathrm{L}^{5,6}$ have been reported to date and the total synthesis of three amphidinolides, $\mathrm{J},{ }^{7} \mathrm{~K},{ }^{8}$ and $\mathrm{P}^{9}$ was recently completed by Williams group. Herein, we describe the stereoselective synthesis of the C12-C17 fragment 3 of amphidinolide $\mathrm{O}(\mathbf{1})$ using a titanium-mediated diastereoselective anti-aldol reaction as a key step.

Retrosynthetically, the amphidinolide O (1) can be bisected into two fragments: the $\mathrm{C} 1-\mathrm{C} 11$ fragment 2 bearing the epoxide and the hemiketal moieties and C12-C17 vinyl iodide fragment 3 (Scheme 1).

The synthesis of vinyl iodide fragment 3 started from chiral propionate ester 4 (Scheme 2). The ( $1 S, 2 R$ )-cis-1-( $p$ -methyl)benzenesulfonamido-2-indanyl ester 4 was prepared in 2 steps from commercially available optically active $(1 S, 2 R)$-cis-aminoindan-2-ol. ${ }^{10}$ The titanium enolate of 4 was generated by the following sequence of reactions, i.e., treatment of $\mathbf{4}$ with $\mathrm{TiCl}_{4}$ ( 1.2 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0^{\circ} \mathrm{C}-25$ ${ }^{\circ} \mathrm{C}$ for 15 min , addition of N -ethyldiisopropylamine (4.0 equiv.) at $25^{\circ} \mathrm{C}$, and finally stirring of the resulting dark brown solution for 2 hr .

The titanium enolate of 4 was then treated with 3-trimethylsilyl-2-propyn-1-al (5) (2.0 equiv.), ${ }^{11}$ which was already precomplexed with $\mathrm{TiCl}_{4}$ ( 2.4 equiv.) at $-78{ }^{\circ} \mathrm{C}$, to provide the anti-aldol product 6 as a major product in $55 \%$ isolated yield. ${ }^{10}$ TMS group of anti-aldol ester $\mathbf{6}$ was remov-

[^0]ed with tetra-n-butylammonium fluoride ( 1.5 equiv., 1.0 M in THF) in THF. ${ }^{12}$ The chiral auxiliary ester 7 was directly esterified with a solution of methyl magnesium chloride (6.0 equiv., 3.0 M in THF) in methanol. ${ }^{13}$ Hydrostannylation of acetylene $\mathbf{8}$ with tributyltin hydride ( 1.5 equiv.) and AIBN (cat.) followed by metal-halogen exchange with iodine (1.2 equiv.) in diethyl ether yielded the desired ( $E$ )-vinyl iodide 10 in $54 \%$ yield over 2 steps. ${ }^{14}$

The tertiary alcohol $\mathbf{1 2}$ was prepared from the iodide to $\mathbf{1 0}$ via a two-step sequence: PMB-protection ${ }^{15}$ of secondary alcohol 10 with 4-methoxybenzyl trichloroacetimidate (1.0 equiv.) and $p$-toluenesulfonic acid (cat.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2} / c$-hexane and then the addition of methyl magnesium chloride (3.0 equiv., 3.0 M in THF) in THF. Finally, dehydration with methanesulfonyl chloride ( 5.0 equiv.) and triethylamine (10.0 equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ produced the target fragment $\mathbf{3}$ in $80 \%$ yield. ${ }^{17}$

Scheme 3. Determination of relative stereochemistry of aldol product 6. (a) $\mathrm{LiAlH}_{4}$, THF, $0^{\circ} \mathrm{C}, 1 \mathrm{hr}, 60 \%$; (b) $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}$, PPTS, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rt}, 12 \mathrm{hr}, 65 \%$.

In order to establish the relative stereochemistry, the antialdol product 6 was converted to the acetonide $\mathbf{1 3}$ by reduction with lithium aluminum hydride ( 2.5 equiv.) in THF at $0{ }^{\circ} \mathrm{C}$ followed by exposure of resulting diol to 2,2dimethoxypropane ( 10.0 equiv.) in the presence of a catalytic amount of pyridinium $p$-toluenesulfonate in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 3). ${ }^{10 \mathrm{a}}$ The relative stereochemistry at C14-C15 was confirmed unambiguously by ${ }^{1} \mathrm{H}$ NOE difference spectroscopy $(1.83 \%$ enhancement of the 20-Me signal upon irradiation of $\mathrm{H}_{\mathrm{a}}$ ) and a coupling constant $J_{\mathrm{ab}}$ of 10.5 Hz , which suggests the anti configurational relationship in $6 .{ }^{10 \mathrm{a}, 16}$

In summary, we have achieved the stereoselective synthesis of C12-C17 fragment $\mathbf{3}$ from the chiral propionate ester $\mathbf{4}$ via 8 step sequences in $6.3 \%$ overall yield.

## Experimental Section

3-Trimethylsilyl-2-propyn-1-al (5). Solid pyridinium chlorochromate ( $1.85 \mathrm{~g}, 8.56 \mathrm{mmol}, 1.1$ equiv.) was added to a stirring solution of 3-trimethylsilyl-2-propyn-1-ol (1.0 g, $7.79 \mathrm{mmol}, 1.0$ equiv.) in dichloromethane ( 15 mL ). Stirring continued in a sealed flask for 6 hr at room temperature. The solution was filtered through a pad of Celite, and the remaining black precipitant in the flask was rinsed with diethyl ether ( 50 mL ) followed by filtration. The filtrates were combined and dried over anhydrous $\mathrm{MgSO}_{4}$, filtered and concentrated to give aldehyde $\mathbf{5}$ as a brown oil in $50 \%$ yield $(0.49 \mathrm{~g})$. The crude aldehyde 5 was used without further purification. TLC $R_{f} 0.60(10 \% \mathrm{EtOAc}$ in hexane); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) \delta 0.22(\mathrm{~s}, 9 \mathrm{H}), 9.20(\mathrm{~s}, 1 \mathrm{H})$.

To a solution of propionate ester $4(1.0 \mathrm{~g}, 2.78 \mathrm{mmol}, 1.0$ equiv.) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(14 \mathrm{~mL})$ was added 1 M solution of $\mathrm{TiCl}_{4}(3.33 \mathrm{~mL}$, $3.33 \mathrm{mmol}, 1.2$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ dropwise via syringe under $\mathrm{N}_{2}$ at $0{ }^{\circ} \mathrm{C}$. The resulting solution was allowed to warm to room temperature and stirred for an additional 15 min. $N$-ethyldiisopropyl- amine $(1.94 \mathrm{~mL}, 11.22 \mathrm{mmol}$, 4.0 equiv.) was added to this solution dropwise at $25^{\circ} \mathrm{C}$ by syringe. The color of the solution became brown after stirring for an additional 1 hr at $25^{\circ} \mathrm{C}$. In a separate flask, to a stirred solution of aldehyde $5(706 \mathrm{mg}, 5.56 \mathrm{mmol}, 2.0$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(28 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$, was added a 1 M solution of $\mathrm{TiCl}_{4}$ ( $6.67 \mathrm{~mL}, 6.67 \mathrm{mmol}, 2.4$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting reaction mixture was stirred at $-78{ }^{\circ} \mathrm{C}$
for 5 min , the above enolate solution was added to the aldehyde 5 solution dropwise via cannula over a period of 5 min . The reaction mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 hr and then it was quenched by addition of aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The layers were separated and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic extracts were washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered and concentrated under reduced pressure to afford a residue which was purified by silica gel chromatography ( $20 \% \mathrm{EtOAc}$ in hexane) to yield the title aldol product 6 ( $743 \mathrm{mg}, 55 \%$ ) as a white solid.
