# Synthesis of Substituted Cyclopentenes from the Baylis-Hillman Adducts via Ring-Closing Metathesis Reaction 

Ka Young Lee, Jeong Eun Na, Jin Yong Lee, ${ }^{\dagger}$ and Jae Nyoung Kim*<br>Department of Chemistry and Institute of Basic Science, Chonnam National University, Kwangju 500-757, Korea<br>${ }^{\dagger}$ Institute for Condensed Matter Theory and Department of Chemistry, Chonnam National University, Kwangju 500-757, Korea Received May 27, 2004

Key Words : Cyclopentenes, Baylis-Hillman adducts, Ring-closing metathesis, Diethyl allylmalonate

Recently, we reported the synthesis of 2,5-dihydrofuran and 2,5-dihydropyrrole systems by using the well-known ring-closing metathesis (RCM) reaction from the slightly modified Baylis-Hillman adducts. ${ }^{1}$ As a continuing effort we intended to synthesize the cyclopentene skeleton as shown in Scheme 1. Cyclopentene ring is a carbon analog of 2,5dihydrofuran and 2,5-dihydropyrrole systems and we thought we could construct the cyclopentene ring by using the similar strategy, namely the combination of BaylisHillman chemistry and RCM reaction.
Substituted cyclopentenes have been synthesized in a variety of ways ${ }^{2-4}$ including the ring-closing metathesis $(\mathrm{RCM})$ reaction ${ }^{2,4}$ and have been used as useful synthetic intermediates and act as an important backbone of some
biologically important compounds. ${ }^{4}$
In order to introduce the required allyl moiety at the secondary position of the Baylis-Hillman adducts we used the well-known consecutive $\mathrm{S}_{N} 2^{\prime}-\mathrm{S}_{N} 2^{\prime}$ strategy involving DABCO salt of the bromide of the Baylis-Hillman adduct 1, which was studied extensively by us and other groups. ${ }^{1,5}$ The reaction of dimethyl allylmalonate and the in-situ generated DABCO salt of $\mathbf{1 a}$ in $\mathrm{CH}_{3} \mathrm{CN}$ gave the corresponding addition-elimination product $\mathbf{2 a}$ in good yield ( $84 \%$ ). When we used aqueous THF instead of acetonitrile, ${ }^{5}$ the introduction of dimethyl allylmalonate required longer reaction time and showed lower yield of product.

With the compound 2a in our hands we examined the RCM reaction. Generally the ring-closing metathesis reaction

| Entry | Condition | $\mathbf{2}(\%$ Yield) | $\mathbf{3}$ (\% Yield) |
| :---: | :---: | :---: | :---: |
| 1 | $\mathrm{rt}, 48 \mathrm{~h}$ | $\mathbf{2 a}(84)$ | $\mathbf{3 a}(95)$ |
| 2 | $\mathrm{rt}, 36 \mathrm{~h}$ | $\mathbf{2 b}(78)$ | $\mathbf{3 b}(89)$ |
| 3 | $30-40^{\circ} \mathrm{C}, 48 \mathrm{~h}$ | $\mathbf{2 c}(80)$ | $\mathbf{3 c}(95)$ |
| 4 | $30-40^{\circ} \mathrm{C}, 44 \mathrm{~h}$ | $\mathbf{2 d}(69)$ | $\mathbf{3 d}(97)$ |
| 5 | $30-40^{\circ} \mathrm{C}, 36 \mathrm{~h}$ | $\mathbf{2 e}(60)$ | $\mathbf{3 e}(99)$ |
| 6 | $30-40^{\circ} \mathrm{C}, 72 \mathrm{~h}$ | $\mathbf{2 f}(75)^{a}$ | $\mathbf{3 f}(90)$ |
| 7 | $30-40^{\circ} \mathrm{C}, 48 \mathrm{~h}$ | $\mathbf{2 g}(59)^{a}$ | $\mathbf{3 g}(93)$ |

${ }^{a}$ The corresponding acetate was used instead of the bromide $\mathbf{1}$.

involving electron-deficient alkene moiety as in 2a-g required the use of second-generation Grubbs catalyst. ${ }^{1,6}$ The reaction of $\mathbf{2 a}$ under the ring-closing metathesis condition using the second-generation Grubbs catalyst (A, $5 \mathrm{~mol} \%$ ) afforded the cyclopentene derivative 3a in excellent yield (95\%). The representative results are summarized in Table 1. As shown, excellent yields of desired RCM products were obtained irrespective of the substituents, ester, acetyl and nitrile.

As a useful transformation, we examined the catalytic hydrogenation reaction of $\mathbf{3 a}$ using $\mathrm{Pd} / \mathrm{C}$ (Scheme 3). The reaction at room temperature ( MeOH under $\mathrm{H}_{2}$ balloon) produced quantitative yield of desired product $\mathbf{4 a}$ in a highly diastereoselective manner. Due to the steric hindrance of the phenyl moiety, the hydrogenation occurred at the opposite face. ${ }^{7}$ Trimethyl 2-phenylcyclopentane-1,1,3-tricarboxylate (4a) can be used for the preparation of 2-phenyl-1,3cyclopentanedicarboxylic acid $^{8}$ via sequential hydrolysis and decarboxylation. ${ }^{9}$
Diastereoselective decarboxylation ${ }^{9}$ and intramolecular Friedel-Crafts acylation reactions with $\mathbf{3 a - g}$ are under progress in order to prepare tricyclic compound, which could be used for further transformation.

## Experimental Section

Typical procedure for the synthesis of 2a. A mixture of the bromide 1a ( $255 \mathrm{mg}, 1 \mathrm{mmol}$ ) and $\operatorname{DABCO}(135 \mathrm{mg}, 1.2$ $\mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(3 \mathrm{~mL})$ was stirred at room temperature for 30 min . To the reaction mixture $\mathrm{K}_{2} \mathrm{CO}_{3}(152 \mathrm{mg}, 1.1$ $\mathrm{mmol})$ and dimethyl allylmalonate $(189 \mathrm{mg}, 1.1 \mathrm{mmol})$ were added and stirred at room temperature for 48 h . After the usual aqueous workup and column chromatographic purification process (hexanes/ether, $10: 1$ ), 2a was obtained as an oil, $291 \mathrm{mg}(84 \%)$. Other compounds were synthesized similarly and their spectroscopic data are as follows.
