Key Words : Chromene, Baylis-Hillman adducts, $\beta$-Diketone, PCC

Recently, chemical transformations using the BaylisHillman adducts have been extensively investigated by us and other groups. ${ }^{1}$ Among them, the reaction of BaylisHillman acetates and $\beta$-diketones or $\beta$-keto esters provided a variety of interesting compounds including alkylidene cyclohexenones, ${ }^{2}$ 2-hydroxyacetophenones, ${ }^{3}$ 3,4-dihydro$2 H$-pyrans, ${ }^{4} \quad 3$-alkylidenebicyclo[3.2.1] octan-8-ones, ${ }^{5} \quad 4$ -arylidenecyclohexane-1,3-diones, ${ }^{6}$ and 4-methylene-2-cyclohexenones. ${ }^{7}$ Recently, 3-benzyl-2-hydroxy-7,8-dihydro- 6 H -quinolin-5-ones were synthesized from the reaction of Baylis-Hillman acetate and cyclic enaminone. ${ }^{8}$
Various kinds of $\alpha$-pyrones and chromene derivatives show interesting biological activities ${ }^{9,10}$ and much synthetic effort has been devoted to the synthesis of them. ${ }^{9,10} \mathrm{We}$ reasoned that we could prepare the chromene skeleton by using the Baylis-Hillman adduct and cyclic $\beta$-diketone as depicted in Scheme 1. The reaction of the Baylis-Hillman
acetate $\mathbf{1}$ and cyclohexane-1,3-dione (2a) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ in DMF gave 3a in $68 \%$ yield. Conversion of 3a into the corresponding lactone derivative 4 a was conducted by refluxing 3a in $p$-xylene to give $\mathbf{4 a}$ in $59 \%$ yield. The exodouble bond of $\mathbf{4 a}$ could be isomerized in its endo-position by treatment with DMAP (4,4-dimethylaminopyridine) in refluxing $p$-xylene to give $\mathbf{5 a}$ in $89 \%$ yield. As easily expected, the reaction of $\mathbf{3 a}$ in the presence of DMAP in refluxing $p$-xylene gave 5a in $75 \%$ yield directly. In addition, compound 5a was synthesized directly from the reaction of $\mathbf{1}$ and $\mathbf{2 a}$ in $78 \%$ yield without separation of the intermediate 3a as also shown in Scheme 1.
As a next trial, we examined the allylic oxidation of $\mathbf{4 a}$ and 5a, and we found that the reaction of $\mathbf{4 a}$ and PCC (pyridinium chlorochlomate) produced the 3-benzoyl derivative $\mathbf{6 a}$ in $63 \%$ yield. ${ }^{11}$ However, the oxidation of $\mathbf{5 a}$ with PCC showed no reaction. Like this we found efficient syn-

thetic methods of both 3-benzyl-7,8-dihydro-6 H -chromene (5a) and 3-benzoyl-7,8-dihydro-6 H -chromene (6a).
In order to check the generality of the reaction we used different types of active methylene compounds $\mathbf{2 b}$-d and obtained similar results as summarized in Table 1 and 2. As shown in Table 1, the use of dimedone ( $\mathbf{2 b}$ ), 5-methylcyclo-hexane-1,3-dione (2c), and 5-phenylcyclohexane-1,3-dione (2d) gave the corresponding 3-benzylchromene derivatives

5b-d in moderate yields (64-81\%) by following the same procedures of Scheme 1. In the same contexts, the corresponding 3-benzoylchromene derivatives $\mathbf{6 b}$-d were obtained in $31-73 \%$ yields analogously by PCC oxidation of $\mathbf{4 b - d}$.
In summary, we disclosed the synthesis of 3-benzyl-7,8-dihydro- 6 H -chromene and 3-benzoyl-7,8-dihydro- 6 H -chromene derivatives starting from Baylis-Hillman adducts in a practically simple process. The studies on the biological activities of prepared compounds are currently underway.

## Experimental Section

Typical procedure for the synthesis of compound 4a: To a stirred solution of the Baylis-Hillman acetate 1 (468 $\mathrm{mg}, 2.0 \mathrm{mmol}$ ) and $\mathbf{2 a}(224 \mathrm{mg}, 2.0 \mathrm{mmol})$ in DMF ( 3 mL ) was added $\mathrm{K}_{2} \mathrm{CO}_{3}(304 \mathrm{mg}, 2.2 \mathrm{mmol})$ and strirred at room temperature for 2 h . The reaction mixture was poured into aqueous HCl solution and extracted with ether. After drying with $\mathrm{MgSO}_{4}$, removal of solvent, and column chromatographic purification process (hexanes/EtOAc, $3: 1$ ) gave pure 3a, 389 mg ( $68 \%$ ). The compound 3a ( $286 \mathrm{mg}, 1.0$ mmol) in $p$-xylene was heated to reflux for 10 h . After removal of solvent and column chromatographic purification process (hexanes/EtOAc, $5: 1$ ) we obtained pure $\mathbf{4 a}, 150 \mathrm{mg}$ (59\%). Other compounds 4b-d were synthesized analogously and the spectroscopic data of $\mathbf{3 a}, \mathbf{4 a - d}$ are as follows.
