#### Abstract

Few $\alpha$-hydroxy- $\beta$-amino acids were synthesized via various nucleophilic addition of the epoxide and followed by stereoselective nucleophilic substitution reaction and eliminative cleavage of the acetal selectively in diacetal compound. One of the synthesized $\alpha$-hydroxy- $\beta$-amino acid reacted with L-leucine methylester to give corresponding dipeptide in good yields.

Key Words: $\alpha$-Hydroxy- $\beta$-amino acids, Nucleophilic addition, Epoxide ring opening, Eliminative cleavage

## Introduction

Amino alcohols especially vicinal syn- and anti-hydroxy amino units are an important class of compounds. Because of these units are constituents of many natural products such as paclitaxel (taxol), KRI 1230 and KRI 1314. In recent years, syn- $\alpha$-hydroxy- $\beta$-amino acids like cyclohexylnorstatine $\mathbf{1}$ have received considerable interest from a pharmaceutical point of view. ${ }^{1}$ Because of cyclohexylnorstatine is the C -terminal residue of KRI 1314 2, a tripeptide with potent rennin inhibitory activity (Fig. 1). ${ }^{2,3}$

Many methods have already been developed for the synthesis of these $\alpha$-hydroxy- $\beta$-amino acid units. ${ }^{4}$ Most of the early studies used chiral natural products as starting materials were limited in their flexibility of structural modification. In

Figure 1. Cyclohexylnorstatine 1 is one of the part of the KRI 1314 which is potent rennin inhibitor.

Figure 2. Regioselective epoxide ring opening reaction for synthesis of diverse $\alpha$-hydroxy- $\beta$-amino acids.
connection with these points, we noticed that a nucleophilic addition of epoxide is very useful methodology for synthesis of various $\alpha$-hydroxy- $\beta$-amino acids. ${ }^{5}$

In this paper, we wish to report synthetic routes for $\alpha$-hy-droxy- $\beta$-amino acid derivatives via the various nucleophilic addition of epoxide and followed by regio- and stereoselective nucleophilic substitution reaction and eliminative cleavage of the acetal selectively in diacetal compounds (Fig. 2).

## Results and Discussion

The compound $\mathbf{1}$ prepared easily by the usual method ${ }^{6}$ from $D$-glucono- $\delta$-lactone. After mesylation and ester reduction of 1, treated with NaOMe to afford epoxide $\mathbf{4}$ in quantitative yield (Scheme 1).

To open epoxide ring of 4, we reacted various nucleophiles such as alkyl lithiums, Grignard reagents and Gilman reagents. Treatment of epoxide 4 with alkyl lithium reagents (methyl lithium, isopropyl lithium and cyclohexyl lithium) gave many undesired product as mixture of stereoselectively and regioselectively uncontroled product. On the other hand, treatment of $\mathbf{4}$ with Grignard reagents (methyl, isopropyl and cyclohexyl Grignard reagents) gave unexpected the halogen attacked compound $(\mathbf{6}, \mathrm{X}=\mathrm{Cl})$ as major product instead of desired 5a-c. After several unsuccessful trials, the ring opening reaction of epoxide $\mathbf{4}$ using Grignard reagents in presence of copper(I) iodide gave alcohol 5 as major product (Table 1). According to these results, we thought the copper(I) iodide is useful for the regioselective ring opening of 4 . Under the these consideration, we reacted 4 with cuprates (Gilman reagent) to give desired product $\mathbf{5 a - c}$ in reasonable yield. ${ }^{7}$

The alcohol 5 was converted to azido compound $\mathbf{8}$ through mesylation and $\mathrm{S}_{\mathrm{N}} 2$ intramolecular displacement by sodium azide. The azido compound $\mathbf{8}$ was hydrogenated with $\mathrm{H}_{2}$ in the presence of $10 \% \mathrm{Pd} / \mathrm{C}$ followed by protection of amino group with 9-phenyl-9-fluorenyl ( Pf ) bromide to give $\mathbf{1 0}$ in good yield (Scheme 2). ${ }^{8}$ At this stage, we introduced the Pf group as a protection of amino group because there are remains many steps should be proceed under the strong acid conditions.

The selective cleavage of terminal isopropylidene group of $\mathbf{1 0}$ was proceed in $70 \%$ acetic acid condition to give $\mathbf{1 1}$ in good yield. ${ }^{9}$ The diol $\mathbf{1 1}$ was converted to alcohol $\mathbf{1 2}$ by using $\mathrm{NaIO}_{4}$ and $\mathrm{NaBH}_{4}$. The alcohol 12 was mesylated and followed by substitution with lithium iodide to give $\mathbf{1 4}$. The isopropylidene iodide 14 was treated with $n$ - BuLi to give allylic alcohol 15
through simultaneous elimination reaction. Allylic alcohol 15 was protected with benzyl bromide and followed by dihydroxylation of alkene with $\mathrm{OsO}_{4}$ to give corresponding diol. ${ }^{10}$ The obtained diol compound oxidizied with $\mathrm{NaIO}_{4}$ to give aldehyde and followed by oxidation with $\mathrm{KMnO}_{4}$ resulted to desired $\alpha$-hydroxy- $\beta$-amino carboxylic acid 17 in good yield. The $\mathbf{1 7 a}$ has different stereochemistry with cyclohexylnorstatine (1) but it has the same skeleton and functional groups and 17b has the same skeleton and functional groups with ( $2 S$, $3 R$ )-3-amino-2-hydroxy-5-methylhexanoic acid which is the N -terminal amino acid of amastatin ${ }^{11}$ that a tripeptide which has been found to inhibit leucine aminopeptidase and aminopeptidase A. ${ }^{12}$

Among of $17 \mathrm{a}, 17 \mathrm{~b}$ and 17 c , compound 17 a reacted with L-leucine methylester under the presence of DCC, HOBT and $\mathrm{Et}_{3} \mathrm{~N}$ in THF to give desired dipeptide $\mathbf{1 8}$ in good yield. Hydrolysis of $\mathbf{1 8}$ by LiOH in mixed solvent (THF : $\mathrm{H}_{2} \mathrm{O}=2$ :

1) to give acid $\mathbf{1 9}$ in quantitative yield. The obtained $\mathbf{1 9}$ was deprotected with $\mathrm{H}_{2}-\mathrm{Pd} / \mathrm{C}$ in MeOH at $70-80^{\circ} \mathrm{C}$ to give desired peptide 20 with $83 \%$ yield (Scheme 3 ).

In conclusion, we reported the result of regioselective reaction of epoxide ring opening by nucleophiles attack. According to survey, regioselective ring opening of epoxide was completed more easily under the conditions of Gilman reagents than Grignard reagents. And also, we synthesized dipeptide $\mathbf{2 0}$ which expecting as a protease inhibitor.

## Experiments

General. All solvents were purified before use with standard drying procedures, unless otherwise specified. Reactions were monitored by TLC using Merck silica gel 60 F-254 plates with UV indicator or/and visualized with phosphomolybdic acid ( $10 \%$ solution in EtOH). All the organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ before concentration in vacuo. Column chromatography was carried out using 230-400 mesh silica gel. Elemental analysis or $\mathrm{C}, \mathrm{H}$ and N are in agreement with the theoretical data, except for compounds containing halogens, where combustion analysis could not be performed. Melting points were measured on Thomas-Hoover melting point apparatus but the temperatures were not corrected. ${ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}$-NMR experiments were conducted on Bruker AW-500 spectrometer. Optical rotation were measured on a Jasco DIP-1000 polarimeter and $[\alpha]_{\mathrm{D}}$ values are given in units of $10^{-1} \mathrm{degcm}^{2} \mathrm{~g}^{-1}$.

Preparation of methyl 3,4;5,6-di- $O$-isopropylidene-2-O-me-thanesulfonyl-D-gluconate (1) and methyl 3,4;5,6-di-O-iso-propylidene-2-O-methanesulfonyl-D-gluconate (2) were prepared according to ref. ${ }^{13}$ and physical and spectral dates were correlated well with previously reported.

Methyl 3,4;5,6-di-O-isopropylidene-2-O-methanesulfonyl-D-glucitol (3). To a solution of compound $2(2.22 \mathrm{~g}, 6.03$ $\mathrm{mmol})$ in $\mathrm{MeOH}(30 \mathrm{~mL})$ was added portionwise $\mathrm{NaBH}_{4}(0.68$ $\mathrm{g}, 18.1 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$ for 3 min and stirred for 11 h and then quenched with water ( 5 mL ). The reaction mixture was extracted with EtOAc $(3 \times 30 \mathrm{~mL})$ and the organic layers were evaporated in vacuo. The combined organic extracts were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated under vacuo. The crude mixture was purified by flash column chromatography (hexane/EtOAc, 9:1, v/v) to afford pure $3(2.03 \mathrm{~g}, 98 \%)$ as an oil. $[\alpha]_{\mathrm{D}}=-6.3\left(c\right.$ 2.20, $\left.\mathrm{CHCl}_{3}\right)$; IR (KRS-5) 3490, 2980, 2970, 2900, 1370, 1360, 1300, 1290, 1280, 1100, $990 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 1.35(\mathrm{~s}, 3 \mathrm{H}), 1.39(\mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~s}, 3 \mathrm{H})$, $1.44(\mathrm{~s}, 3 \mathrm{H}), 2.64-2.67(\mathrm{t},-\mathrm{OH}, J=6.7 \mathrm{~Hz}), 3.14(\mathrm{~s}, 3 \mathrm{H})$, 3.92-3.97 (m, 4H), 4.04-4.07 (m, 1H), 4.18-4.24 (m, 2H), 4.82 $(\mathrm{q}, 1 \mathrm{H}, J=4.4 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 110.6$, 110.3, 81.9, 79.9, 77.8, 76.8, 68.1, 63.0, 38.9, 30.9, 27.2, 26.6,

General preparation of epoxy 5a, 5b and 5c: Representative procedure for the preparation of 1-deoxy-1-cyclohexyl-3,4;5,6-$\boldsymbol{O}$-diisopropylidene- $\boldsymbol{D}$-mannose (5a). To a solution of dried $\mathrm{CuI}(1.37 \mathrm{~g}, 7.2 \mathrm{mmol}, 99.99 \%)$ in ether ( 20 mL ) was slowly added dropwise for 5 min cyclohexylmagnesium chloride ( 4 mL , 8.0 mmol ) at $-20{ }^{\circ} \mathrm{C}$. After stirring for 5 min , compound 4 $(0.488 \mathrm{~g}, 2.00 \mathrm{mmol})$ dissolved in ether $(10 \mathrm{~mL})$ added for 5 min via cannula and stirred for 30 min . To the reaction mixture added saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 5 mL ) and stirred additional 20 min . The reaction quenched with water $(30 \mathrm{~mL})$ and extracted with EtOAc ( $30 \mathrm{~mL} \times 3$ ). The organic layer washed with water ( $30 \mathrm{~mL} \times 2$ ) and brine and dried with anhydrous $\mathrm{MgSO}_{4}$. Filtration and removal of the solvent gave a dark yellow oil which was further purified by flash column chromatography (hexane/EtOAc, 10/1, v/v) to afford pure $\mathbf{5 a}(1.67 \mathrm{~g}, 70 \%)$ as white solid.

General preparation of $17 \mathrm{a}, 17 \mathrm{~b}$ and $17 \mathrm{c}:$ Representative procedure for the preparation of ( $2 R, 3 R$ )-2-benzyloxy-4-cy-clohexyl-3-(9-phenyl-9H-fluoren-9-ylamino)-1-pentanoic acid (17a). To a solution of $\mathbf{1 6 a}(1.00 \mathrm{~g}, 1.95 \mathrm{mmol})$ in acetone $(20 \mathrm{~mL})$ was added $\mathrm{NMO}(0.66 \mathrm{~g}, 6.23 \mathrm{mmol})$ and catalytic amount of $\mathrm{OsO}_{4}$ at $0{ }^{\circ} \mathrm{C}$. The reaction mixture stirred for 12 h , and added water $(30 \mathrm{~mL})$ and stirred for 10 min at rt . The reaction mixture extracted with EtOAc $(3 \times 30 \mathrm{~mL})$. The combined organic extracts were dried with anhydrous $\mathrm{MgSO}_{4}$ and evaporated under vacuo. The crude product dissolved in $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}(1: 1,20 \mathrm{~mL})$ and added $\mathrm{NaIO}_{4}(0.54 \mathrm{~g}, 2.53 \mathrm{mmol})$ at rt . and stirred for 1 h . The solvent was evaporated under vacuo and the crude mixture dissolved in THF/ $\mathrm{H}_{2} \mathrm{O}(1: 1,20 \mathrm{~mL})$ and added $\mathrm{K}_{2} \mathrm{CO}_{3}(0.54 \mathrm{~g}, 0.39 \mathrm{mmol})$ and stirred for 5 h . at rt . The reaction mixture extracted with EtOAc $(3 \times 30 \mathrm{~mL})$ and combined organic extracts were dried with anhydrous $\mathrm{MgSO}_{4}$
and evaporated under vacuo. The crude mixture was purified by flash column chromatography (hexane/EtOAc, 1:2, v/v) to afford pure $17 \mathrm{a}(0.78 \mathrm{~g}, 75 \%)$ as an oil.
