## Experimental

Melting points were determined using Büchi 510 melting point apparatus and uncorrected. IR spectra were recorded on a Nicolet MAGNA 560-FTIR spectrometer. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker Advance DPX-300, Bruker Advance DPX-500 instruments and Agilent 400-MR ( 400 MHz ) instrument using $d_{6}$-DMSO or $\mathrm{CDCl}_{3}$ as a reference or internal deuterium lock. The chemical shift data for each signal are given in units of $d$ (ppm) relative to tetramethylsilane (TMS) where $d$ (TMS) $=0$, and referenced to the solvent residual. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker Advance-300 ( 75.4 MHz ) instrument and Agilent $400-\mathrm{MR}$ ( 100 MHz ) instrument using internal deuterium lock and proton decoupling. Mass spectra were obtained on a JEOL JMS-AX505WA instrument. Thermal stability of the polymer was analyzed by the thermogravimetric analysis measurements on a Shimadzu TGA-2950 instrument at a heating rate of $10{ }^{\circ} \mathrm{C} \mathrm{min}^{-1}$ in a nitrogen flow. The glass transition temperature ( $T_{\mathrm{g}}$ ) was measured using a PerkinElmer Pyris-1 DSC from $20^{\circ} \mathrm{C}$ to $310^{\circ} \mathrm{C}$ with a scan rate of $10{ }^{\circ} \mathrm{C} \mathrm{min}^{-1}$ under nitrogen. UV-visible absorption spectra and fluorescence spectra were measured with Hewlett Packard 8452A diode array spectrometer and SPEX Fluorolog-t2 fluorometer (model FL 112, 450 W , xenon lamp), respectively, using spectral grade $\mathrm{CHCl}_{3}$ as a solvent. The measurements were carried out at $25^{\circ} \mathrm{C}$ using a quartz cell with a path length of 1 cm . All electrochemical measurements were made with a COMPACTSTAT potentiostat (IVIUM Technologies) using an Pt wire reference electrode in 0.1 M tetrabutylammonium hexafluorophosphate ( $n-\mathrm{Bu}_{4} \mathrm{NPF}_{6}$ ) in anhydrous $\mathrm{CH}_{3} \mathrm{CN}$. Typical cyclic voltammograms were recorded using ITO electrodes as the working electrode and a platinum coil counter electrode. The ferrocene/ferrocenium $\left(\mathrm{Fc} / \mathrm{Fc}^{+}\right)$redox couple was used as an external reference. The potential values were converted to versus $\mathrm{Ag} / \mathrm{AgCl}$. Molar masses were determined by Gel Permeation Chromatography (GPC) using two PL Gel $30 \mathrm{~cm} 5 \mu \mathrm{~m}$ mixed C columns at 30 ${ }^{\circ} \mathrm{C}$ running in THF and calibrated against polystyrene ( $M_{\mathrm{n}}=$ $600-10^{6} \mathrm{~g} / \mathrm{mol}$ ) standards using a Knauer refractive index detector. The X-ray diffraction patterns of the oligomer thin film were recorded using a Philips XPERT-PRO MRD diffractometer by employing a scanning range (20) from $1^{\circ}$ to $30^{\circ}$ with a $\mathrm{CuK} \alpha 1 \mathrm{X}-\mathrm{ray}(\lambda=1.540598 \AA)$.

Reagents were purified and dried by standard technique. All air and water-sensitive synthetic manipulations were performed under a nitrogen atmosphere using standard Schlenk techniques.

Ice cold aqueous hydrochloric acid ( $2.0 \mathrm{M} ; 24 \mathrm{~mL}$ ) was then cautiously added and the temperature was allowed to increase to room temperature. Water $(100 \mathrm{~mL})$ was added and the reaction mixture was extracted with chloroform $(3 \times 30 \mathrm{~mL})$.
