#### Abstract

Several bisphosphine- and bisphosphite-substituted Re-imido complexes have been prepared from $\operatorname{Re}(\mathrm{NPh})$ $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{1}$, and $\mathrm{Re}\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl}_{3}(\mathrm{py}), 4$. Compound $\mathbf{1}$ reacted with trimethyl phosphite $\left(\mathrm{P}(\mathrm{OMe})_{3}\right)$ to give a mixture of two isomers, mer, trans $-\operatorname{Re}(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}$, 2, and fac, cis- $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}$, 2a. In this reaction, the mer,trans-isomer is a major product. Complex 1 also reacted with triethylphosphine $\left(\mathrm{PEt}_{3}\right)$ to exclusively give mer, trans- $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{PEt}_{3}\right)_{2} \mathrm{Cl}_{3}$, 3. Compound 4 reacted with trimethylphosphine $\left(\mathrm{PMe}_{3}\right)$ to give mer,trans $-\mathrm{Re}\left(\mathrm{N}^{2}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)\left(\mathrm{PMe}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{5}$, which was converted to mer- $\mathrm{Re}\left(\mathrm{N}^{2}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)(\mathrm{PMe})\left(\mathrm{OPMe}_{3}\right) \mathrm{Cl}_{3}, \mathbf{6}$, on exposure to air. Crystallographic data for 2: monoclinic space group $P 2_{1} / n, a=8.870$ (2) $\AA, b=14.393(3) \AA$, $c=17.114(4) \AA, \beta=101.43(2)^{\circ}, Z=4, R\left(w R_{2}\right)=0.0521(0.1293)$. Crystallographic data for 5: orthorhombic space group $\mathrm{P} 2_{1} 2_{1} 2_{1}, a=11.307(1) \AA, b=11.802(1) \AA, c=19.193(2) \AA, Z=4, R\left(w R_{2}\right)=0.0250(0.0593)$. Crystallographic data for 6: orthorhombic space group $P 2_{2} 2_{1} 2_{1}, a=14.036(4) \AA, b=16.486(5) \AA, c=11.397(3) \AA$, $Z=4, R\left(w R_{2}\right)=0.0261(0.0630)$.

## Introduction

Transition-metal imido complexes have been of continuous interest..$^{1-6}$ Three general types of imido complexes are now known, ${ }^{1}$ although Cundari's theoretical studies led to a conclusion that a minimum of eight resonance structures are required to describe the metal imido linkage. ${ }^{7}$ The imido ligand can be considered to bond to a transition metal with one $\sigma$ and either one or two $\pi$ bonds. Limiting valence bond descriptions of this interaction are shown below.

Structure A depicts an $s p^{2}$-hybridized nitrogen leading to an $\mathrm{M}=\mathrm{N}$ double bond $(1 \sigma, 1 \pi)$ and a bent $\mathrm{M}-\mathrm{N}-\mathrm{R}$ linkage with the lone pair in an $\mathrm{N}\left(s p^{2}\right)$ hybrid orbital. In the closedshell formalism, the imido dianion $[\mathrm{NR}]^{2-}$ in $\mathbf{A}$ acts as a fourelectron donor. Some zero-valent metals ( $\mathrm{Cr}, \mathrm{W}$ ) are known to possess a bent imido ligand (A)..$^{8,9}$ In addition, bent imido species with a formal M-N double bond are known to be more reactive than linear ones, because nucleophilic reactivity is enhanced in the bent NR ligand. ${ }^{10-16}$ Structure B depicts an $s p$-hybridized nitrogen with the lone pair in an $\mathrm{N}(p)$ atomic orbital that does not participate in the $s p$ hybridization. In $\mathbf{B}$, the $\mathrm{M}=\mathrm{N}$ double bond $(1 \sigma, 1 \pi)$ is maintained if symmetry restrictions or an energy mismatch with available metal orbitals does not allow donation of the lone pair on the nitrogen atom to the metal. In $\mathbf{B}$, the imido ligand acts as a

[^0]formal four-electron donor. The more common complexes of metals in a high oxidation state have a linear imido ligand (C). Structure $\mathbf{C}$ depicts an $s p$-hybridized nitrogen leading to an $\mathrm{M} \equiv \mathrm{N}$ triple bond $(1 \sigma, 2 \pi)$ and a linear M-N-R linkage, where the nitrogen lone pair $p(\pi)$ to $\mathrm{M}\left(d_{\pi}\right)$ donation is very effective. In $\mathbf{C}$, the imido liagnd acts as a formal six-electron donor. Wigley pointed out that in cases where multiple $\pi$ donor ligands are present in the molecule, a molecular orbital approach is required to accurately describe imido bonding. ${ }^{1}$

Recently we have prepared several Re-imido complexes of the type $\operatorname{Re}(\mathrm{NPh}) \mathrm{Cl}_{3}\left(\mathrm{PPh}_{3}\right) \mathrm{L}$ or $\operatorname{Re}(\mathrm{NPh}) \mathrm{Cl}_{3} \mathrm{~L}_{2}$ from the reactions of $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{3}$ with small, strongly coordinating ligands $\left(\mathrm{L}=\mathrm{CO}, \mathrm{P}(\mathrm{OMe})_{3}, \mathrm{PMe}_{3}\right)$ (eq 1 and 2). ${ }^{17-19}$ Because of our continuous interest in the complexes of this type, we tried to prepare other bisphosphine- and bisphos-phite-substituted Re-imido complexes. Herein we report preparation, structure, and some properties of $\operatorname{Re}(\mathrm{NAr})\left(\mathrm{PR}_{3}\right)_{2} \mathrm{Cl}_{3}$ $\left(\mathrm{PR}_{3}=\mathrm{PMe}_{3}, \mathrm{PEt}_{3}, \mathrm{P}(\mathrm{OMe})_{3} ; \mathrm{Ar}=\mathrm{C}_{6} \mathrm{H}_{5}, 2,6-i-\mathrm{Pr}_{2}-\mathrm{C}_{6} \mathrm{H}_{3}\right)$.

Unless otherwise stated, all the reactions have been performed with standard Schlenk line and cannula techniques under an argon atmosphere. Air-sensitive solids were manip-
ulated in a glove box filled with argon. Glassware was soaked in KOH-saturated 2-propanol for $c a .24 \mathrm{~h}$ and washed with distilled water and acetone before use. Glassware was either flame-dried or oven-dried. Hydrocarbon solvents were stirred over concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ for $c a .48 \mathrm{~h}$, neutralized with $\mathrm{K}_{2} \mathrm{CO}_{3}$, stirred over sodium metal, and distilled by vacuum transfer. Benzene, diethyl ether, toluene, and tetrahydrofuran (THF) were stirred over sodium metal and distilled by vacuum transfer. NMR solvent $\left(\mathrm{CDCl}_{3}\right)$ was degassed by freeze-pump-thaw cycles before use and stored over molecular sieves under argon. 2,6-Diisopropylaniline $\left(\mathrm{H}_{2} \mathrm{~N}-\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)$ was distilled over $\mathrm{CaH}_{2} . \mathrm{CO}(99.9 \%)$ was purchased from Union Gas company and use as received. Re metal, trimethylphosphine ( $\mathrm{PMe}_{3}, 1 \mathrm{M}$ in toluene), trimethyl phosphite $\left(\mathrm{P}(\mathrm{OMe})_{3}\right)$, triethylphosphine $\left(\mathrm{PEt}_{3}, 1 \mathrm{M}\right.$ in THF), triphenylphosphine $\left(\mathrm{PPh}_{3}\right)$, sodium cyclopentadienylide ( NaCp ; $\mathrm{Cp}=\mathrm{C}_{5} \mathrm{H}_{5}, 2 \mathrm{M}$ in THF), thallium cyclopentadienylide (TlCp), sodium pentamethylcyclopentadienylide ( $\mathrm{NaCp}^{*} ; \mathrm{Cp}^{*}=\mathrm{C}_{5} \mathrm{Me}_{5}, 0.5 \mathrm{M}$ in THF), $\mathrm{LiBEt}_{3} \mathrm{H}$, and $\mathrm{LiBEt}_{3} \mathrm{D}$ were purchased from Aldrich company and used as received. $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{1},{ }^{20}$ and $\operatorname{Re}\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl}_{3}$ (py), 4, ${ }^{21,22}$ were prepared by the literature methods.
${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra were recorded with a Bruker AMX 500 MHz spectrometer with reference to internal solvent resonances and reported relative to tetramethylsilane. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra were also recorded with a Bruker AMX 500 MHz spectrometer with reference to external $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$. IR spectra were recorded with a Nicolet 205 FTIR spectrophotometer. Melting points were measured with a Thomas Hoover capillary melting point apparatus without calibration. Elemental analyses were performed by the Korea Basic Science Center.
Preparation of $\operatorname{Re}(\mathbf{N P h})\left(\mathbf{P}(\mathbf{O M e})_{3}\right)_{2} \mathrm{Cl}_{3}, 2$ and 2 a . Heating ( 30 min ) $2.0 \mathrm{~g}(2.2 \mathrm{mmol})$ of $\mathbf{1}$ with 1.10 mL of $\mathrm{P}(\mathrm{OMe})_{3}$ $(9.2 \mathrm{mmol})$ under reflux in benzene $(60 \mathrm{~mL})$ gave a green solution, and then the solvent was removed under vacuum to give green gummy solids. The resulting solids were washed with diethyl ether $(2 \times 25 \mathrm{~mL})$ and then dried under vacuum to give $1.09 \mathrm{~g}(1.90 \mathrm{mmol}, 87 \%)$ of a mixture of isomers, mer,trans- $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{2}$, and fac, cis- $\mathrm{Re}(\mathrm{NPh})-$ $\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}$, 2a. This product mixture conveniently recrystallized from acetone-hexane. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 7.804-$ $7.277\left(5 \mathrm{H}, \mathrm{m}\right.$, phenyl), $3.954\left(18 \mathrm{H}, \mathrm{t}, J_{\mathrm{P}-\mathrm{H}}=5.3 \mathrm{~Hz}, \mathrm{P}(\mathrm{OMe})_{3}\right.$ for 2a), $3.879\left(18 \mathrm{H}, \mathrm{d}, J_{\mathrm{P}-\mathrm{H}}=10.6 \mathrm{~Hz}, \mathrm{P}(\mathrm{OMe})_{3}\right.$ for 2). ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 130.2-124.1$ (phenyl), 54.4 (t, $J_{\mathrm{P}-\mathrm{C}}$ $=54.4 \mathrm{~Hz}$, for 2), $50.9\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=80.5\right.$ for $\left.\mathbf{2 a}\right) .{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 81.7$ (2a), 72.1 (2). Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{23} \mathrm{NO}_{6}-\mathrm{P}_{2} \mathrm{Cl}_{3} \mathrm{Re}: \mathrm{C}, 22.81 ; \mathrm{H}, 3.67$; $\mathrm{N}, 2.22$. Found: C, 23.12; H, 3.97; N, 1.87. Mp (decomp.): 126-128 ${ }^{\circ} \mathrm{C}$. IR (KBr): 2955, 1178, 1050, 1024, 807, 779, 767, 750, 684, 527 $\mathrm{cm}^{-1}$.
Preparation of mer,trans- $\mathrm{Re}(\mathbf{N P h})\left(\mathrm{PEt}_{3}\right)_{2} \mathbf{C l}_{3}$, 3. Heating ( 4 h$) 0.80 \mathrm{~g}(0.88 \mathrm{mmol})$ of $\mathbf{1}$ with $2.0 \mathrm{~mL}(2.0 \mathrm{mmol})$ of $\mathrm{PEt}_{3}$ ( 1 M in THF) under reflux in benzene ( 60 mL ) gave a light green solution, and then the solvent was removed under vacuum to give green solids. The resulting solids were washed with hexane ( $3 \times 25 \mathrm{~mL}$ ) and then dried under vac-
uum to give $0.45 \mathrm{~g}(0.73 \mathrm{mmol}, 83 \%)$ of $\mathbf{3}$. This product conveniently recrystallized from benzene-hexane. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 7.738-7.263(5 \mathrm{H}, \mathrm{m}$, phenyl), $2.210(12 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{PCH}_{2} \mathrm{CH}_{3}\right), 1.163\left(18 \mathrm{H}, \mathrm{m}, \mathrm{PCH}_{2} \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right): \delta 130.2-119.8$ (phenyl), $14.8\left(\mathrm{t}, J_{\mathrm{P}-\mathrm{C}}=14.3 \mathrm{~Hz}\right.$, $\left.\mathrm{PCH}_{2} \mathrm{CH}_{3}\right)$, $7.4\left(\mathrm{~s}, \mathrm{PCH}_{2} \mathrm{CH}_{3}\right) .{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ -23.3 (s). Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{35} \mathrm{NP}_{2} \mathrm{Cl}_{3} \mathrm{Re}: \mathrm{C}, 34.87$; H , 5.69; N, 2.26. Found: C, 35.38; H, 5.76; N, 2.02. X-ray Structure Determination. All X-ray data were collected with use of either an Enraf-Nonius CAD4 diffractometer (for 2 and 6) or an Mac Sciences MXC diffractometer (for 5), both of which are equipped with an Mo X-ray tube and a graphite crystal monochromator. Details on crystal data and intensity data are given in Table 1 . The orientation matrix and unit cell parameters were determined by least-squares analyses of the setting angles of 25 reflections in the range $20.0^{\circ}<2 \theta<30.0^{\circ}$. Three check reflections were measured every 100 reflections throughout data collection and showed no significant variations in intensity. Intensity data were corrected for Lorenz and polarization effects. Decay corrections were also made. The intensity data were empirically corrected with $\psi$-scan data. All calculations were

carried out with use of the SHELXS-86 and SHELXL-93 programs. ${ }^{23,24}$

A light green crystal of 2, shaped as a block, of approximate dimensions $0.3 \times 0.3 \times 0.4 \mathrm{~mm}^{3}$, was used for crystal and intensity data collection. The unit cell parameters and systematic absences, $h 0 l(h+l=2 n+1)$ and $0 k 0(k=2 n+$ 1 ), unambiguously indicated $P 2_{1} / n$ as a space group. The structure was solved by the heavy atom method. All nonhydrogen atoms were refined anisotropically. All hydrogen atoms were generated in idealized positions and refined using a riding model.

A green crystal of $\mathbf{5}$, shaped as a block, of approximate dimensions $0.2 \times 0.3 \times 0.5 \mathrm{~mm}^{3}$, was used for crystal and intensity data collection. The unit cell parameters and systematic absences, $h 00(h=2 n+1), 0 k 0(k=2 n+1)$, and $00 l$ ( $l=2 n+1$ ), unambiguously indicated $P 2_{1} 2_{1} 2_{1}$ as a space group. The structure was solved by the heavy atom method. Five (C13-C17) out of six carbon atoms in the two trimethylphosphine ligands exhibited a structural disorder and the best fit was obtained by considering the carbon atoms to be distributed over two positions with the site occupation factors of $0.54: 0.46$ (C13-C17 : C13A-C17A). The other nonhydrogen atoms were refined anisotropically. All hydrogen atoms were generated in idealized positions and refined using a riding model.

Equivalent isotropic $U$ defined as one third of the trace of the orthogonalized $U_{i j}$ tensor.

A green crystal of $\mathbf{6}$, shaped as a block, of approximate dimensions $0.3 \times 0.4 \times 0.4 \mathrm{~mm}^{3}$, was used for crystal and intensity data collection. The unit cell parameters and systematic absences, $h 00(h=2 n+1), 0 k 0(k=2 n+1)$, and $00 l$ ( $l=2 n+1$ ), unambiguously indicated $P 2_{1} 2_{1} 2_{1}$ as a space group. The structure was solved by the heavy atom method. All non-hydrogen atoms were refined anisotropically. All hydrogen atoms were generated in idealized positions and refined using a riding model.

Final atomic positional parameters for non-hydrogen atoms for are shown in Tables 2-4. The selected bond distances and bond angles are shown in Tables 5 and 6.

## Results and Discussion

Preparation. Compound 1 reacts with $\mathrm{P}(\mathrm{OMe})_{3}$ in a refluxing benzene to give a mixture of two isomers, mer,trans$\mathrm{Re}(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{2}$, and fac, cis-Re$(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}$, 2a, approximately in a ratio of $9: 1$ on the basis of ${ }^{1} \mathrm{H}$ NMR peak intensities (eq 3 ). This reaction is therefore more stereoselective, compared to that employed for preparation of a $\mathrm{PMe}_{3}$ analogue, in which the corresponding product ration is

Equivalent isotropic $U$ defined as one third of the trace of the orthogonalized $U_{i j}$ tensor.
4.6:1. ${ }^{19}$ Several attempts to separate 2a from the product mixture have not been successful. This mixture, however, has crystallized only in the mer,trans- $\mathrm{Re}(\mathrm{NPh})\left(\mathrm{P}(\mathrm{OMe})_{3}\right)_{2} \mathrm{Cl}_{3}$ (2). Variable-temperature (20, 30, $40,50^{\circ} \mathrm{C}$ in $\mathrm{CDCl}_{3}$ ) ${ }^{1} \mathrm{H}$ NMR spectra of 2 show that the intensity ratio of 9:1 remains intact and there is almost no change in chemical shifts of $\mathrm{P}(\mathrm{OMe})_{3}$ protons.

In ${ }^{1} \mathrm{H}$ NMR spectra, methyl protons of $\mathrm{P}(\mathrm{OMe})_{3}$ in 2 exhibit a sharp triplet at $\delta 3.954$, analogous to the $\mathrm{PMe}_{3}$ analogue, ${ }^{19}$ because of their virtual coupling to the two strongly

Equivalent isotropic $U$ defined as one third of the trace of the orthogonalized $U_{i j}$ tensor.
coupled trans phosphorus nuclei ( $J_{\mathrm{P}-\mathrm{H}}=5.3 \mathrm{~Hz}$ )..$^{25}{ }^{1} \mathrm{H}$ NMR spectra of 2a show a sharp doublet at $\delta 3.879\left(J_{\text {P-H }}=10.6\right.$ Hz ), which indicates a cis-orientation of the two $\mathrm{P}(\mathrm{OMe})_{3}$ ligands.

Compound 1 also reacts with $\mathrm{PEt}_{3}$ in a refluxing benzene to exclusively give mer,trans $-\mathrm{Re}(\mathrm{NPh})\left(\mathrm{PEt}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{3}$ in $83 \%$ yield (eq 4). ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra of $\mathbf{3}$ exhibit a triplet at $\delta$ $14.8\left(J_{\mathrm{P}-\mathrm{C}}=14.3 \mathrm{~Hz}\right)$, owing to the virtual coupling of the carbon nucleus to the two trans phosphorus nuclei. ${ }^{25-31}$ $\mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectra of $\mathbf{3}$ exhibit a singlet at $\delta-23.3$ as expected. The NMR data mentioned above indicate that the two $\mathrm{PEt}_{3}$ ligands are placed trans to each other in 3.

Compound 4 reacts with $\mathrm{PMe}_{3}$ in benzene at room temperature to give mer,trans- $\mathrm{Re}\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)\left(\mathrm{PMe}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{5}$, in moderate yield (eq 5). The Re metal has been formally

reduced from $\operatorname{Re}(+7)$ in $\mathbf{4}$ to $\operatorname{Re}(+5)$ in 5 . It is worth noting that the strongly bound imido ligand $\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)$ has been replaced during the reaction. Unfortunately, we cannot
give an explanation for these reactivities, the imido abstraction and the Re metal reduction.

In ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{5}$, methyl protons of $\mathrm{PMe}_{3}$ exhibit a triplet at $\delta 1.642\left(J_{\mathrm{P}-\mathrm{H}}=4.6 \mathrm{~Hz}\right)$, because of their virtual coupling to the two trans phosphorus nuclei. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectra of 5 exhibit a triplet at $\delta 12.8\left(J_{\text {P-C }}=66.8 \mathrm{~Hz}\right)$, also because of the virtual coupling of the carbon nucleus to the

two phosphorus nuclei. ${ }^{25}$ As expected, ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra of 5 exhibit a singlet at $\delta-40.7$.

Structure. Molecular structures with their atomic numbering schemes for 2, 5, and 6 are shown in Figures 1-3. The coordination sphere of the Re metal in 2 can be described as a slightly distorted octahedron. Compound 2 has an NPh group, three mer -Cl atoms, and two trans $-\mathrm{P}(\mathrm{OMe})_{3}$ ligands. The equatorial plane, defined by $\mathrm{Re}, \mathrm{N}, \mathrm{Cl} 1, \mathrm{Cl} 2$, and Cl 3 , is nearly planar with the average atomic displacement from the least-squares plane not exceeding $0.074 \AA$. The dihedral

Figure 1. ORTEP drawing ${ }^{28}$ of 2 showing the atom-labeling scheme and $50 \%$ probability thermal ellipsoids.

Figure 2. $O R T E P$ drawing of 5.

Figure 3. ORTEP drawing of 6 .
angle between the equatorial plane and the imido phenyl ring (C1-C6) is $19.0(4)^{\circ}$.
The coordination sphere of the Re metal in $\mathbf{5}$ can also be described as a slightly distorted octahedron. Compound $\mathbf{5}$ has an NAr group, three mer-Cl atoms, and two trans- $\mathrm{PMe}_{3}$ groups. The equatorial plane, defined by $\mathrm{Re}, \mathrm{N} 1, \mathrm{Cl1}, \mathrm{Cl} 2$, and Cl 3 , is essentially planar with the average atomic displacement of $0.002 \AA$ A.
The coordination sphere of the Re metal in $\mathbf{6}$ can be described as a slightly distorted octahedron. Compound 6 has an NAr group, three $m e r-\mathrm{Cl}$ atoms, and one $\mathrm{PMe}_{3}$ group trans to Cl , and one $\mathrm{OPMe}_{3}$ group trans to the imido ligand (NAr). The equatorial plane, defined by $\mathrm{P} 1, \mathrm{Cl} 1, \mathrm{Cl} 2$, and Cl 3 , is nearly planar with the average atomic displacement of $0.016 \AA$. The Re metal lies $0.258 \AA$ above this plane.
Of particular interest are the bonding parameters of the Re-N-C bond. The Re-N-C bond angles of $172.4(5)^{\circ}$ $177.5(6)^{\circ}$ in $\mathbf{2}, 5$, and $\mathbf{6}$, are fairly typical of phenyl imido ligands in high oxidation state complexes, in which the metal is relatively electron-deficient and some $\pi$ bonding between the imido nitrogen atom and the metal is likely. ${ }^{1}$ These angles, therefore, indicate that the imido groups in $\mathbf{2 , 5}$, and 6, are linear and the Re-N bonds have a triple bond character
with an $s p$-hybrid nitrogen. The Re-N bond distance of $1.680(7)-1.721(6) \AA$ are also consistent with those found for aryl imido ligands coordinated to rhenium. ${ }^{3}$ All the Re-P and Re-C bond distances are within the ranges for known $\operatorname{Re}(\mathrm{V})$ complexes. ${ }^{26}$
Property. Any sign of reaction has not been observed in reactions of $\mathbf{2}$ with mild alkylating reagents such as $\mathrm{ZnMe}_{2}$, $\mathrm{ZnEt}_{2}, \mathrm{AlMe}_{3}$, and $\mathrm{AlEt}_{3}$. Moreover, 2 does not react with strong carbon nucleophiles such as $\mathrm{LiCp}, \mathrm{NaCp}, \mathrm{TlCp}$, $\mathrm{NaCp}^{*}\left(\mathrm{Cp}=\mathrm{C}_{5} \mathrm{H}_{5}, \mathrm{Cp}^{*}=\mathrm{C}_{5} \mathrm{Me}_{5}\right)$ and Grignard reagents $(\mathrm{MeMgBr}, \mathrm{EtMgBr})$ even under vigorous conditions (refluxing toluene). Compound $\mathbf{2}$ is also inert toward hydrides $\left(\mathrm{LiBEt}_{3} \mathrm{H}, \mathrm{LiBEt}_{3} \mathrm{D}\right)$. In constrast to $\mathbf{2}$, compound $\mathbf{5}$ reacts with Grignard reagents, although it does not react $\mathrm{ZnR}_{2}$, $\mathrm{AlR}_{3}, \mathrm{MCp}(\mathrm{M}=\mathrm{Li}, \mathrm{Cp}, \mathrm{Tl}), \mathrm{NaCp}^{*}$, or hydrides. Unfortunately, reactions of $\mathbf{5}$ with $\mathrm{RMgBr}(\mathrm{R}=\mathrm{Me}$, Et) gave too many intractable species and therefore we could not obtain meaningful spectral data.
Compound 5 is gradually oxidized to mer $-\operatorname{Re}\left(\mathrm{N}_{-} \mathrm{C}_{6} \mathrm{H}_{3}-i-\right.$ $\left.\mathrm{Pr}_{2}\right)\left(\mathrm{PMe}_{3}\right)\left(\mathrm{OPMe}_{3}\right) \mathrm{Cl}_{3}, \mathbf{6}$, when the recrystallization of $\mathbf{5}$ is attempted from benzene-pentane (eq 6). It is interesting to note that only one of the both $\mathrm{PMe}_{3}$ ligands in $\mathbf{5}$ has been converted to the corresponding phosphine oxide $\left(\mathrm{OPMe}_{3}\right)$ and the mutual orientation of the phosphines has also been changed from trans to cis. If the Re metal is thought of as having a formal oxidation state of +5 and if the imido group is thought of as acting as a four-electron donor, then $\mathbf{5}$ can be described as a saturated, 18 -electron complex, and therefore this reaction $(\mathbf{5} \rightarrow \mathbf{6})$ is likely to involve a dissociative fashion. In addition, the intermediate, probably formed by $\mathrm{PMe}_{3}$ dissociation, seems to have undergone pseudo-rotation, considering the cis orientation of the $\mathrm{PMe}_{3}$ and $\mathrm{OPMe}_{3}$ ligands in 6. In order to get some insight into the mechanism for the formation of $\mathbf{6}$, compound $\mathbf{5}$ has been treated with excess ( 10 fold) $\mathrm{O}=\mathrm{PPh}_{3}$, but no reaction has occurred.

In ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{6}$, methyl protons of $\mathrm{OPMe}_{3}$ exhibit a doublet at $\delta 1.709\left(J_{\mathrm{P}-\mathrm{H}}=13.0 \mathrm{~Hz}\right)$, and those of $\mathrm{PMe}_{3}$ a doublet at $\delta 1.547\left(J_{\mathrm{P}-\mathrm{H}}=16.0 \mathrm{~Hz}\right)$. In ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectra of $\mathbf{6}$, the $\mathrm{OPMe}_{3}$ carbons exhibit a doublet at $\delta 16.4$ $\left(J_{\text {P.C }}=71.1 \mathrm{~Hz}\right)$ and $\mathrm{PMe}_{3}$ carbons also a doublet at $\delta 15.3$ $\left(J_{\text {P-C }}=35.5 \mathrm{~Hz}\right)$. As expected, ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$-NMR spectra of 6 exhibit two phosphorus resonances at $\delta 65.3$ (d, $J_{\text {P-P }}=8.5$ Hz ) for $\mathrm{OPMe}_{3}$ and $\delta-39.5\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{P}}=8.5 \mathrm{~Hz}\right.$ ) for $\mathrm{PMe}_{3}$. The strong IR band at $1107 \mathrm{~cm}^{-1}$ is assigned to the $\mathrm{P}=\mathrm{O}$ bond in OPMe $_{3}$.
Recently, Bergman and his coworkers reported an insertion of CO into an $\mathrm{Ir}=\mathrm{N}$ bond in $\mathrm{Cp} * \mathrm{Ir}\left(=\mathrm{N}^{\prime} \mathrm{Bu}\right)$, which is the first carbonylation of a terminal imido ligand to give an isocyanate complex. ${ }^{27}$ These results prompted us to investigate the possibility of the CO insertion into Re-imido bonds in
our compounds. However, no reactions of $\mathbf{2 , 3}$, or $\mathbf{5}$ with CO have been observed.

In summary, several bisphosphine- and bisphosphite-substituted Re -imido complexes have been prepared from $\mathrm{Re}(\mathrm{NPh})$ $\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{3}, \mathbf{1}$, and $\operatorname{Re}\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl}_{3}(\mathrm{py}), 4$. Vigorous reaction conditions (refluxing benzene solutions) are required for reactions of 1 with $\mathrm{P}(\mathrm{OMe})_{3}$ or $\mathrm{PEt}_{3}$, whereas mild conditions (room-temperature benzene solutions) for reactions of 4 with $\mathrm{PMe}_{3}$. All the products are air-stable in the solid state, but they are air-sensitive in solution. For example, $\mathbf{5}$ is converted to 6 on exposure to air during recrystallization and therefore the contact of solutions of the products with air should be avoided. Compound 2 is remarkably inert to carbon nucleophiles $\left(\mathrm{ZnR}_{2}: \mathrm{R}=\mathrm{Me}, \mathrm{Et} ; \mathrm{AlR}_{3}: \mathrm{R}=\mathrm{Me}, \mathrm{Et}\right.$; $\mathrm{RMgBr}: \mathrm{R}=\mathrm{Me}, \mathrm{Et} ; \mathrm{MCp}: \mathrm{M}=\mathrm{Li}, \mathrm{Na}, \mathrm{Tl} ; \mathrm{NaCp} *)$ and hydrides $\left(\mathrm{LiBEt}_{3} \mathrm{H}, \mathrm{LiBEt}_{3} \mathrm{D}\right)$.
Acknowledgment. This work is based on research sponsored by the Korea Ministry of Education under grant BSRI-98-3420.

Supplementary Material Available. Tables of bond distances and bond angles, anisotropic thermal parameters, positional parameters for hydrogen atoms (12 pages); listings of observed and calculated structure factors (19 pages). Supplementary materials are available from one of the authors (S.W. Lee) upon request.
