Faculty of Specific Education, Zagazig University, Zagazig, Egypt [†]Department of Chemistry, Faculty of Science, Zagazig University, Zagazig, Egypt [‡]Department of Chemistry, College of Science, Qatar University, Doha, Qatar (Received March 28, 2007)

요 약. Urea는 높은 온도(60~80 °C)의 수용색 상태에서 PtCl₂, H₂[PtCl₆]·6H₂O, H₂[IrCl₆] Ni(CH₃CO₂)₂ 와반응해서 각각 (1)[PtCl₂(Urea)]·2H₂O, (2)(NH₄)₂[PtCl₆], (3)(NH₄)₂[IrCl₆]·H₂O, (4)[Ni₂(OH)₂(NCO)₂(H₂O)₂]의 complexes를 생성 한다. complexe 1에서 urea는 중성 bidentate 리간드로써 Pt(II)와 배위한다. complexe 2,3,4에서는 높은 온도에서 반 응하는 동안 배위 urea분자들이 분해되고 다양한 반응생성물들을 얻을 수 있다. 모든 complexes은 각각 적당한 수득률 로 dark green(1) yellow(2), pale brown (3) faint green(4)의 침전물로 분리된다. 반응생성물은 열분석, IR, ¹H and ¹³C NMR spectra에 의해 측정 되었다. 이 complexes의 구성을 설명하는 일반적인 매카니즘이 제시되었다.

주제어: 합성, Urea, Platinum, Nickel, Iridium, IR, NMR Spectra, 열분석

ABSTRACT. Urea reacts with PtCl₂, H₂[PtCl₆]6H₂O, H₂[IrCl₆] and Ni(CH₃CO₂)₂ in aqueous solution at high temperature (60-80 °C) yielding [PtCl₂(Urea)]·2H₂O (1), (NH₄)₂[PtCl₆] (2), (NH₄)₂[IrCl₆]·H₂O (3) and [Ni₂(OH)₂(NCO)₂(H₂O)₂] (4) complexes, respectively. In complex 1, urea coordinates to Pt(II) as a neutral bidentate ligand *via* amido nitrogen atoms. In complexes 2, 3 and 4 it seems that the coordinated urea molecules decompose during the reaction at high temperature and a variety of reaction products are obtained. All complexes were isolated in moderate yields as dark green (1), yellow (2), pale brown (3) and faint green (4) precipitates, respectively. The reaction products were characterized by their micro-analysis, IR, ¹H and ¹³C NMR spectra as well as thermal analysis. General mechanisms describing the formation of these complexes were suggested.

Keywords: Synthesis, Urea, Platinum, Nickel, Iridium, IR, NMR Spectra, Thermal Analysis

INTRODUCTION

From a coordination chemistry prospective, urea could potentially be a neutral ligand for transition metals and coordinates as a monodentate either via its oxygen¹ or nitrogen atoms² or as a bidentate chelating or bridging ligand depending on the type of metal ion.²⁻⁵ Biologically, many hydrolytic enzymes employ two metal ions to facilitate the concentrated binding of substrate and addition or elimina-

tion of water.⁶⁻⁸ Urease is a nickel-dependent mtalloenzyme that catalyzes the hydrolysis of urea to ammonia and carbon dioxide.⁴ Urease employs a nonequivalent pair of nickel ions to facilitate the concerted binding of the substrate at one center and nucleophilic attack of water or hydroxide at the other center.⁹⁻¹¹

The reactions between various transition metal ions with urea at room temperature have been studied extensively and many metal–urea complexes have been isolated and characterized.¹²⁻¹⁶ Recently, we have found that reaction of urea with various metal ions at high temperature proceeds with different mode in which the coordinated urea molecules decompose and a variety of reaction products have been obtained.¹⁷⁻²³ The rule played by metal ions in decomposing coordinated urea seems to be depending upon the type of metal ion and the nature of the counter ions involved in the reaction as well as on the reaction temperature.

The present investigation was reported to study the course of the reaction of urea with PtCl₂, H₂[PtCl₆]·6H₂O, H₂[IrCl₆] and Ni(CH₃CO₂)₂·4H₂O at *ca.* 60-80 °C. The reaction products were characterized by their elemental analyses, infrared, ¹H and ¹³C NMR spectra as well as thermal analysis. The obtained complexes are identified as [PtCl₂(Urea)]·2H₂O (1), (NH₄)₂[PtCl₆] (2), (NH₄)₂[IrCl₆]·H₂O (3) and [Ni₂(OH)₂(NCO)₂(H₂O)₂] (4), respectively.

EXPERIMENTAL

All of the chemical used throughout this investigation were extra pure grade and used without further purification.

Infrared spectra of the reactants and the obtained complexes were recorded from KBr discs (4000-400) using a Buck scientific 500-IR spectrophotometer. Thermal gravimetric analysis (TG) and (DTG) were carried out using a Perkin-Elmer TGA-7 computerized thermal analysis system. The rate of heating of samples was kept at 10 °C min⁻¹. Sample mass of 0.397 mg was analysed under N₂ flow of 30 ml min⁻¹. Microanalyses were performed by the Microanalysis Unit of Cairo University, Egypt using CHNS-932

(LECO) and vario-EL (elmentar Analysensysteme) elemental analyzers.

¹H and ¹³C NMR spectra were recorded on Varian spectrometers Gemini 200, VXR 400 and Unity 500 operating at 200, 400 and 500 MHz for ¹H, respectively. Solvent signals (¹H, ¹³C) were used as internal references.

$[PtCl_2(Urea)] \cdot 2H_2O(1)$

To a suspension of platinum(II) chloride (0.531 g, 0.01 mol) in 10 ml of distilled water, a solution (10 ml) of urea (0.720 g, 0.06 mol) was added. The mixture was stirred at room temperature for about 24 h. The obtained clear solution was then stirred for about 8 h at *ca*. 60 °C (in a water bath). The resulting precipitate of [PtCl₂(Urea)]·2H₂O (1) (dark green) was then filtered out, washed several times with hot distilled water and dried at 50 °C in an oven for 3 h and then in a desiccator in *vacuo*. Yield: 0.465 g (64.3%).

Anal. found: C, 3.29; H, 2.35; Cl, 18.98; N, 7.84. Anal. calc. for $CH_8Cl_2N_2O_3Pt$ (362.07): C, 3.32; H, 2.23; Cl, 19.58; N, 7.74.

$(NH_4)_2[PtCl_6]$ (2)

To a solution, (5 ml) of $H_2[PtC1_6]\cdot 6H_2O$ (0.518 g, 0.01 mol) in water, a solution (10 ml) of urea (0.360 g, 0.06 mol) was added. The resulting clear yellow solution was stirred for about 8 h at *ca*. 60 °C (in a water bath). The resulting yellow precipitate of compound **2** was filtered off, washed several times with hot distilled water and MeOH and then dried in a desiccator in *vacuo*. Yield: 0.190 g (42.8%).

Anal. found: Cl, 45.94; H, 1.96; N, 6.05.

Anal. calc. for Cl₆H₈N₂Pt (443.87): Cl, 47.92; H, 1.82; N, 6.31.

$(NH_4)_2[IrCl_6] \cdot H_2O(3)$

To a water solution (10 ml) of $H_2[IrCl_6]$ (0.814 g, 0.01 mol), a solution (10 ml) of urea (0.720 g, 0.06 mol) was added. The resulting clear solution was stirred for about 8 h at *ca*. 65 °C (in a water bath), there was changing in colour of the reaction mixture from dark brown to red. The precipitate of compound (3) (pale brown) was then obtained by

Journal of the Korean Chemical Society

the addition of acetone dropwisly with stirring that was filtered off, washed several times with acetone and then dried in a desiccator in *vacuo*. Yield: 0.103 g (11.2%).

Anal. found: Cl, 45.58; H, 2.50; N, 6.55.

Anal. calc. for $Cl_6H_{10}IrN_2O$ (459.03): Cl, 46.34; H, 2.20; N, 6.10.

$[Ni_2(OH)_2(NCO)_2(H_2O)_2]$ (4)

To a solution (20 ml) of nickel(II) acetate tetrahydrate, Ni(CH₃CO₂)₂·4H₂O (0.498 g, 0.01 mol) in water, a solution (20 ml) of urea (0.720 g, 0.06 mol) was added. The clear solution was stirred for about 4-6 h at *ca*. 80 °C (in a water bath) resulting in precipitation of a faint green compound that was filtered off, washed several times with hot distilled water, dried at 50 °C in an oven for 4 h and then in a desiccator in *vacuo*. Yield: 0.200 g (36.8%).

Anal. found: C, 9.01; H, 2.41; N, 9.84.

Anal. calc. for C₂H₆N₂Ni₂O₆ (271.47): C, 8.85; H, 2.23; N, 10.32.

RESULTS AND DISCUSSION

Urea reacts with platinum(II) chloride in aqueous solution at 60 °C to form a dark green complex identified as [PtCl₂(Urea)]·2H₂O (1). In this complex, urea coordinates to Pt(II) as a bidentate chelating ligand via its nitrogen atoms. The infrared spectrum of the complex shows the characteristic bands of N-coordinated urea. Assignments of the infrared bands in the complex spectra in comparison with those of free urea were given in Table 1. The formation of $N \rightarrow Pt$ coordination bond causes significant changes in many of characteristic urea vibrations. The N-H stretching vibrations are shifted to lower values²⁴. On the other hand, the observed stretching vibration of the carbonyl group, n(C=O) in the complex spectrum is shifted to a higher value indicating that oxygen atom is not the donor site, see Table 1. Furthermore the stretching vibration, v(N-C) was observed at a lower frequency (1390 cm⁻¹) in comparison with its corresponding value in free urea (1463 cm^{-1}). This is in consistent with the previously known³ for N-coordinated urea. The

deformation (bending and in-pane rocking) motions of NH₂ group are observed at 1615 and 1184 cm⁻¹, respectively. The appearance of only one band in the region characteristic for the bending vibration of NH₂ at 1615 cm⁻¹ indicate that both NH₂ groups are coordinated to Pt(II) ion and urea acts as chelating ligand.²⁵ The geometry associated with complex is likely square planar with two chloro and two nitrogens constituting the coordination sphere of platinum(II) ion. This conclusion was also supported by the data obtained from ¹H and ¹³C NMR measurements. Table 4. Only one signal is observed in ¹H NMR spectrum of [PtCl₂(Urea)]·2H₂O complex and strongly down field shifted (7.36 ppm) in comparison with its value in free urea (5.64 ppm). Further more the ¹³C NMR spectra of the complex and free urea show only one signal at approximately the same value. These two observations are consistent with a chelating bidentate nature for urea through the two nitrogen atoms.

Urea seems to interact with hexachloroplatinic or hexachloroiridic acid in a different mode giving $Urea \xrightarrow{\begin{array}{c} +H_{2}[PtCl_{6}] \ 6H_{2}O \\ H_{2}O \ ; \ 60 \ ^{\circ}C \end{array}} (NH_{4})_{2}[PtCl_{6}] \ (2) + CO_{2} \\ H_{2}O \ ; \ 60 \ ^{\circ}C \\ H_{2}O \ ; \ 60 \ ^{\circ}C \end{array}$

complexes **2** and **3**, respectively. The formation of such complexes upon heating of an aqueous mixture of urea with $H_2[PtCl_6]$ and $H_2[IrCl_6]$, (see *Scheme* 1), were clearly identified from their infrared and ¹H NMR spectra (*Fig.* 1, *Tables* 2, 4). The asymmetric and symmetric stretching motions for N-H were observed at lower frequencies in both complexes, *Table* 2, in comparison with their values in free urea and in consistent with those known for ammonium ion.^{3,6-29} Such way of interaction was further sup-

ported by observing the stretching motion for M-Cl bond in $[PtCl_6]^{2-}$ and $[IrCl_6]^{2-}$ moieties at 337 and 306 cm⁻¹, respectively [30]. ¹H NMR spectra of the complexes (NH₄)₂[PtCl₆] and (NH₄)₂[IrCl₆]·H₂O strongly support this conclusion, there is no signals correspond to urea observed but instead a new broad singlet signal around 7.3 ppm assigned to NH_4^+ is observed.

The catalytic decomposition of urea in presence of hexchloroplatinic or hexachloroiridic acids could be explained as follows:

 $\begin{aligned} \mathrm{NH_2CONH_2} + \mathrm{H_2O} &\rightarrow \mathrm{NH_2CO_2^-} + \mathrm{NH_4^+} \\ \mathrm{NH_2CO_2^-} + 2\mathrm{H^+} &\rightarrow \mathrm{NH_4^+} + \mathrm{CO_2} \end{aligned}$

An aqueous solution of nickel(II) acetate was found to interact with urea at ca. 80 °C and a faint green powder precipitate of complex (4) is obtained. The complex was isolated in a good yield and identified by microanalysis, IR, ¹³C NMR spectra and thermal analysis. The IR spectrum of the complex 4 is shown in Fig. 2A and its band assignments are given in Table 3. The infrared spectrum shows no bands either due to coordinated urea or acetate ions but instead a group of bands characteristic for coordinated isocyanato, coordinated water molecules and bridged hydroxo groups. The complex spectrum show the presence of bands characteristic for coordinated terminal isocyanato group at 2240 and 2080 cm⁻¹ at higher wavenumbers as expected in comparison with the corresponding bridged isocyanato ions.3,20,35 The stretching vibration of the

of bands lying at lower wavenumbers 478-393 cm⁻¹ associated with the vibrational motions of Ni-O and Ni-N bonds were also observed [39]. ¹H and ¹³C NMR spectra of the complex $[Ni_2(OH)_2(NCO)_2(H_2O)_2]$ shows no signals due to free or coordinated urea, but instead a new signal at 124.0 in the ¹³C NMR spectrum is observed corresponds to NCO ligand. Based on this data together with the elemental and thermal analysis we identified the obtained product as binuclear nickel(II) complex, $[Ni_2(OH)_2(NCO)_2(H_2O)_2]$ and the most probable structure associated with this formula is shown in Formula 1.

It is well known that urea coordinates to Ni(II) ions at room temperature forming the $[Ni(urea)_4]^{2+}$ complex ion.^{2,30-32} At high temperature the following reaction may take place:

$$2[Ni(Urea)_{4}](CH_{3}CO_{2})_{2} + 10 H_{2}O^{\delta^{0}C} \rightarrow \\ [Ni_{2}(OH)_{2} (NCO)_{2}(H_{2}O)_{2}] (4) \\ + 4CH_{3}CO_{2}H + 6CO_{2} + 14NH_{3}$$

The catalytic decomposition of urea and the formation of NCO⁻ group in presence of nickel acetate salt could be explained as follows:^{33,34}

$$\begin{array}{l} \mathrm{NH_2CONH_2+H_2O} \rightarrow \mathrm{NCO^-} + \mathrm{NH_4^+} \\ \mathrm{NH_4^+} + \mathrm{H_2O} \rightarrow \mathrm{NH_3} + \mathrm{H^+} \end{array}$$

Thermogravimetric (TG) and derivative of thermogravimetric analysis (DTG) were carried out for complex 4 under N_2 flow, *Fig.* 3. The obtained ther-

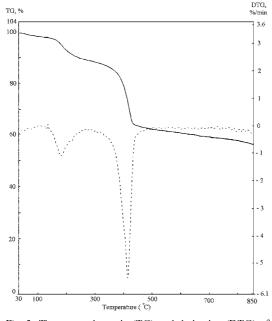

Fig. 3. Thermogravimeteric (TG) and derivative (DTG) of complex **4**.

mal data strongly support the proposed complex formula and indicate that the mode of thermal decomposition occurs in two stages. The first stage lies at a maximum temperature of 175.6 °C and is accompanied by a weight loss of 13.4% corresponding to the loss of two water molecules in consistent with the calculated value of 13.26%. The infra red spectrum obtained for the residue at this stage (at 200 °C) clearly show the disappearance of bands due to water molecules and the presence of the characteristic bands due to OH- and NCOgroups, see Fig. 2B. The second stage was observed at 414.0 °C and is accompanied by a weight loss of 31% associated with the loss of two HNCO units in good agreement with the calculated values of 31.17% according to the following reactions:

 $[\text{Ni}_2(\text{OH})_2(\text{NCO})_2(\text{H}_2\text{O})_2] \xrightarrow{175.6^\circ\text{C}} [\text{Ni}_2(\text{OH})_2(\text{NCO})_2] + 2\text{H}_2\text{O}$ $[\text{Ni}_2(\text{OH})_2(\text{NCO})_2] \xrightarrow{414.0^\circ\text{C}} 2\text{NiO} + 2\text{HNCO}$

The infrared spectrum for the final residue left after this temperature strongly supports this conclu-

sion see *Fig.* 2C. The spectrum shows only the characteristic bands associated with NiO.
